Mainframe Integration – Handling Legacy Application Challenges

Glenn Schneck

Principal Techincal Architect -GT Software

gschneck@gtsoftware.com

IBM Mainframes Retain the System of Record

CICS Systems for Banks (ATM, Ioans, account management)

CICS Systems for Insurance (Claims & policy management)

Mainframe Systems for Manufacturing

Mainframe Systems for Finance

Mainframe Systems for Medical

Mainframe Systems for Airline

Mainframes are DEAD??

- 71% of Fortune 500 companies use mainframes
- Mainframes handle 87% of all credit card transactions
- Mainframes handle 68% of the world's production IT resources, yet they account for only 6% of IT costs
- Mainframes handle 30 BILLION business transactions a day
- As of 2017, 92 of the world's top 100 Banks continued to use mainframes

Source: <u>https://blog.syncsort.com/2018/06/mainframe/9-mainframe-statistics/</u>

Today's Business Needs

Build and deploy API's rapidly Web self-service, mobile/cloud, BYOD Real-time access to enterprise data residing on any platform Integrated views of related information Customer and business focused IT Industry standards Integration between mainframe & distributed systems

CICS API's : We are already doing that!!!!!

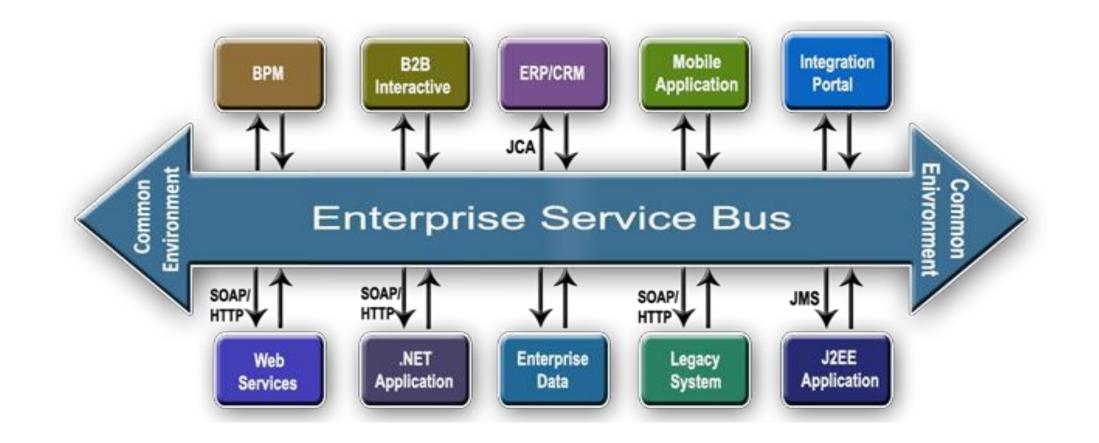

Lessons Learned, War Stories, Successes

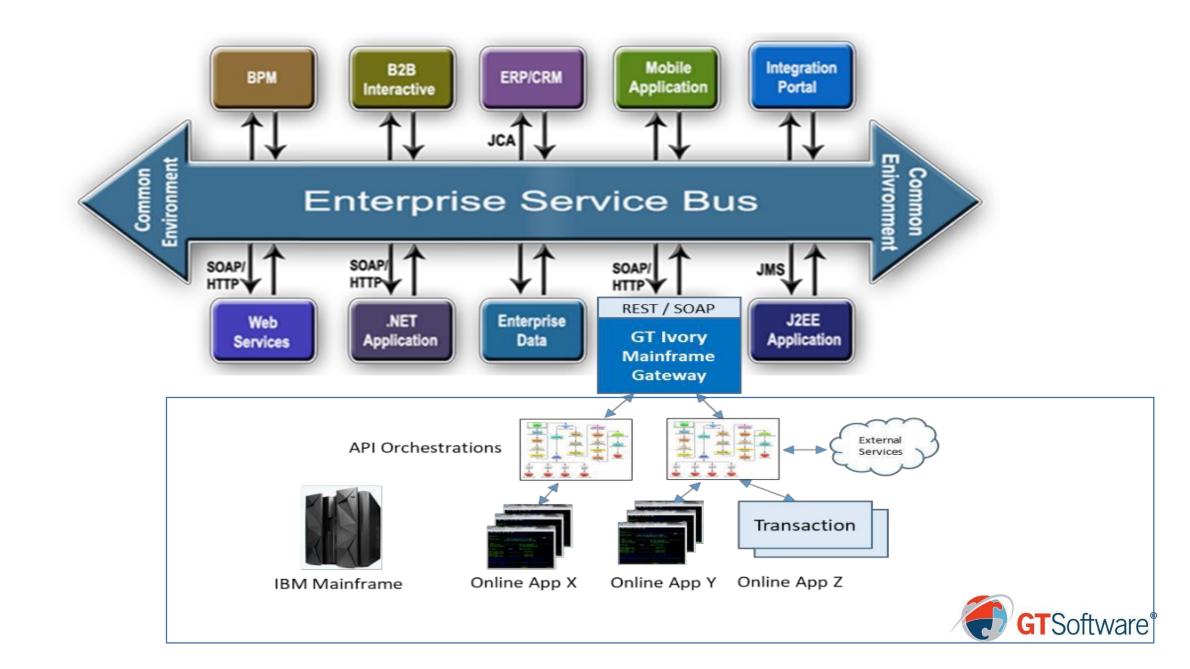

What else do we need to consider??

Do You Have the Right Mainframe Integration Technologies?

- How old are your legacy backend applications?
- What technologies are they using?
- Is the application code structured or unstructured?
- Did your core applications first start out as commercial offerings?
- What third-party components are embedded in the code?
- How complex is the code and data structure design?
- Do your support teams fully understand the application?
- How many coding 'standards' have been used over the past years?

Understanding Your Legacy Applications & API Requirements

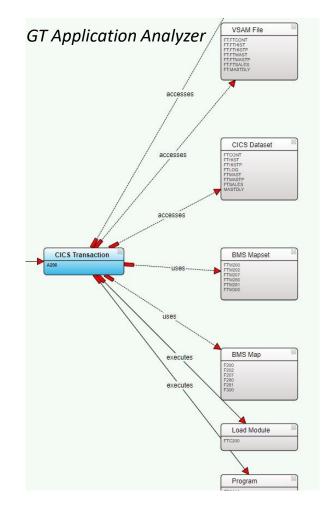

- Most mainframe online applications were designed to interact with 3270 terminals (end user dialog).
- Integration technologies should be transparent to the backend systems.
- Changing legacy code to work better as an API introduces more complexity and code to manage.
- Fine grain APIs (microservices) may be easier to build, but put more work onto the consumer.
- More intelligent the API, less effort for the API consumer processing logic.
- Legacy mainframe apps are like a box of chocolates, it is hard to see what is inside.

Legacy Application Complexities – CICS and IMS

- XCTL/ multiple program calls
- Multiple input and output messages
- Variable length, multi-part messages, different layouts
- Complex structures (REDEFINES & ODO)
- Null terminations, non-standard code
- Screen macros
- Conversational dialogs
- External and other 3270 applications
- Complex Conversational Transactions

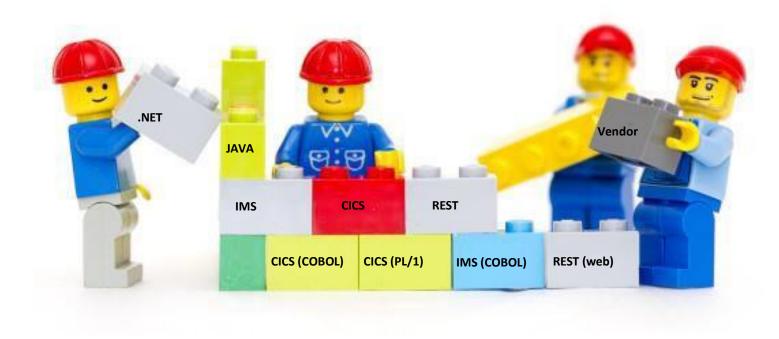

APIs are building blocks

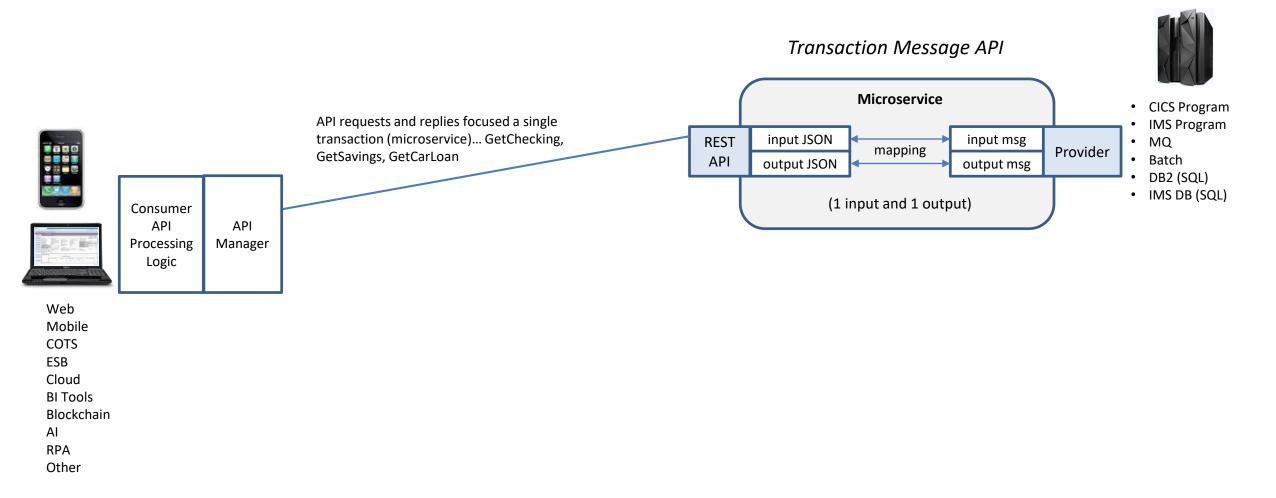

APIs are building blocks

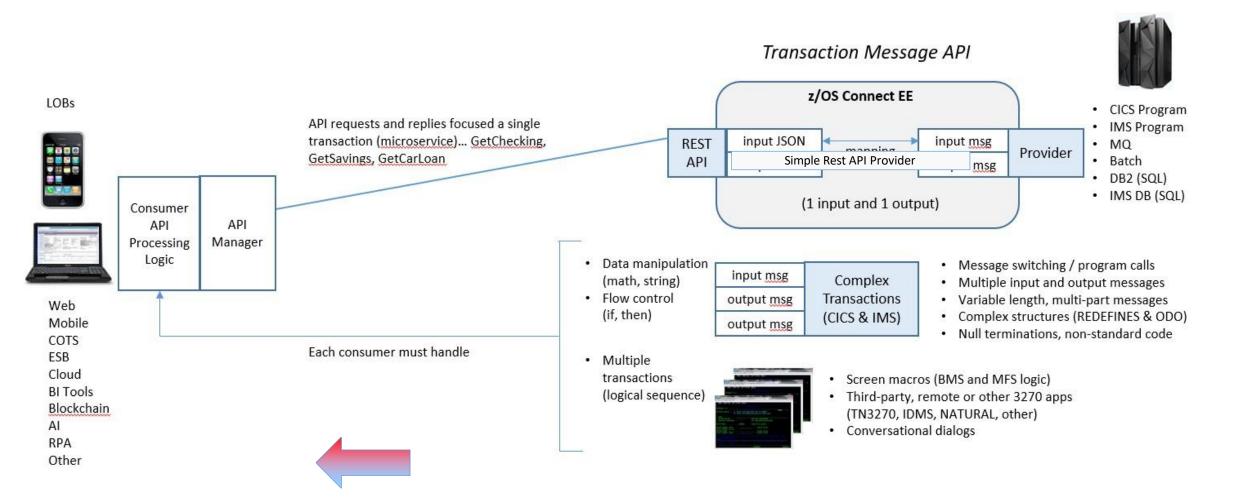

Mainframe APIs – Understanding Legacy Environments & Integration Requirements

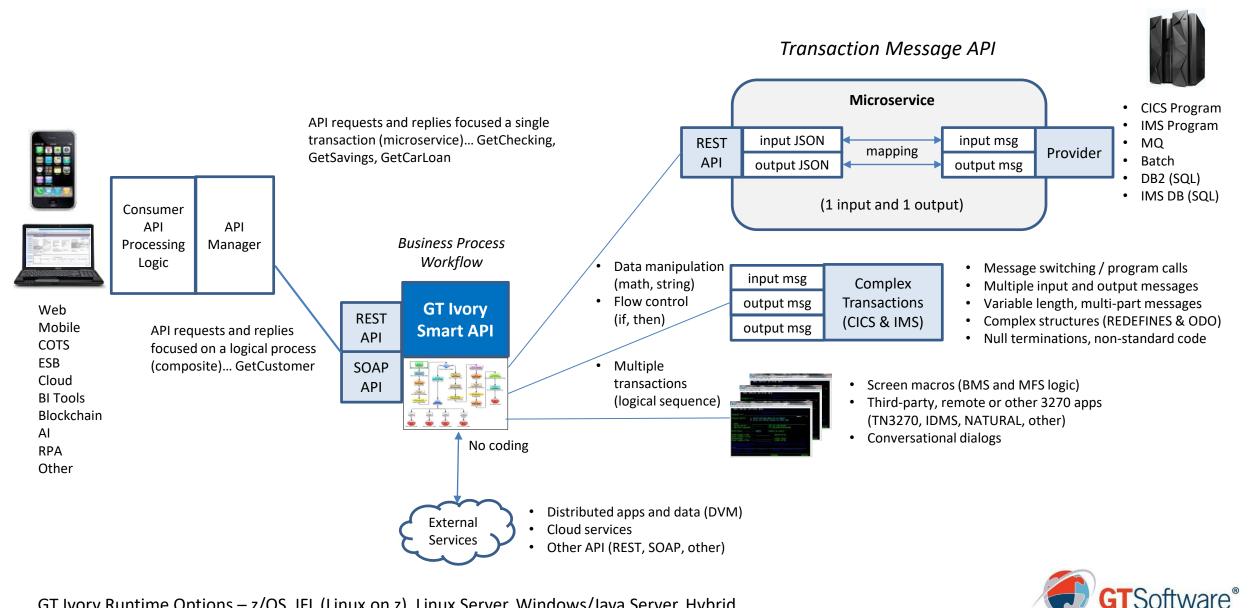

Mainframe APIs – Understanding Legacy Environments & Integration Requirements

Mainframe APIs – Understanding Legacy Environments & Integration Requirements

GT Ivory Runtime Options – z/OS, IFL (Linux on z), Linux Server, Windows/Java Server, Hybrid

Environment

• CICS

Environment

- CICS
- Ivory Service Architect (API creation & orchestration)
- Github (source version control)
- Jenkins (automation)
- .NET , Java, Node.js , COBOL
- Linux (redhat) JBOSS
- Tomcat
- MoogSoft
- dynatrace
- urbancode

urban {code}

API Lessons Learned

COBOL and PL/1

THE GOOD	THE BAD	THE UGLY
All Data Structures Supported	Some structures don't map well to distributed Apps	Comp-3, Binary , ODO REDEFINES, unbounded sequences (PL/1)
All can be exposed as service inputs/outputs	Names in COBOL-PL/1 may be cryptic and need to be renamed	Blank When Zero.
Can expose existing programs without changes	May need more data to drive than the app knows	Message switches, and other calls

01 VAR-RECORD.

.

05 REC-OTHER-DATA PIC X(30). 05 REC-AMT-CNT PIC 9(4). 05 REC-AMT PIC 9(5) 0CCURS 1 TO 100 TIMES DEPENDING ON REC-AMT-CNT. 1 INSTRING UNALIGNED, 2 FIX_PART, 3 CERTNO CHAR(9), 3 COUNTZ FIXED DECIMAL(1,0), 2 VAR_PART (7 REFER (COUNTZ)) CHAR(10);

CICS or IMS Transactions

THE GOOD	THE BAD	THE UGLY
Existing Transactions can be exposed as REST or SOAP	A Transaction may be too fine grained	Multiple Transactions may have to be used in service
Data from transaction returned as a service output	Data may be to convoluted to use in service	Volume of data may be too large to return to distributed client
PFKEY = TRANCODE	Maybe need multiple Trans	Maybe need to call multiple Trans in sequence

CICS and/or IMS Transactions Combined

THE GOOD	THE BAD	THE UGLY
Combine Transactions in one service	May not work well with others	API's that run for minutes
Use Conversational Transactions	Long running conversations may be long running API's	No understanding of conversational impact
No Code re-write	May be easier to combine logic to keep from calling multiples transactions	May return different copybook

Even Uglier...

Null Termination x'3F' (IMS MFS)

- Ex. 03 LAST-NAME PIC X(20). | 'RIVERS
- To: 'RIVERS 'D9C9E5C5D9E2<mark>3F</mark>'
- XML: <lastName>RIVERS3#A2<lastName>

Null Termination x'00'

- Ex. 03 NAME PIC X(20). | 'RIVERS DUSTY 'D9C9E5C5D9E24040400000C4D9E2E3E8
- To: 'RIVERS 'D9C9E5C5D9E2'
- XML: <NAME>RIVERS<NAME>

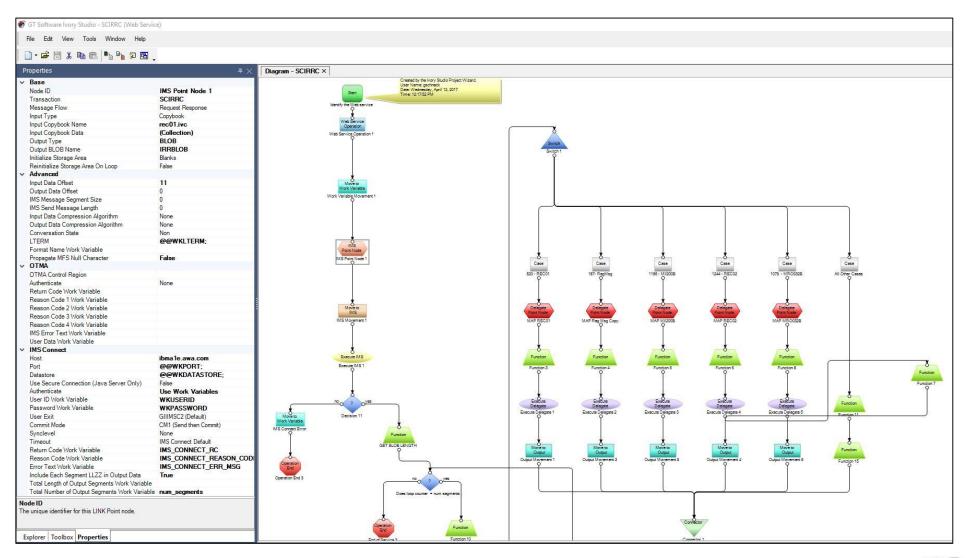

Design Methodology

- Base Services (closely matched to individual Transactions when possible)
- **Composite Services** (combined calling of multiple base services for business services)

• Outbound calls to third party software from COBOL

Ivory API – Online Transaction with Multiple Variable-length Output Messages

Financial

- Domestic Banks
- Domestic Insurance
- International Banks
- International Insurance

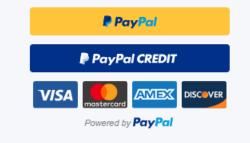

Banking

- CICS systems of record
- Instant Payment (Europe)
- Outbound calls to Google resources
- Outbound calls to Credit resources
- Outbound calls to Account Control Website
- Outbound calls to Terrorist Check sites
- Inbound API calls to existing CICS Trans with no code change
- ATM system inbound API's (SOAP then REST)

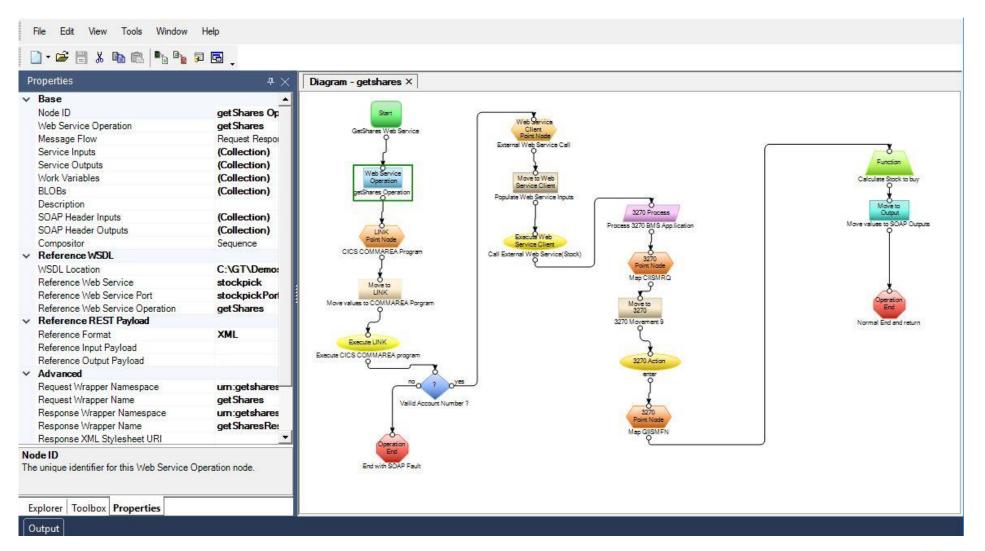

https://maps.googleapis.com/maps/api/geocode/json?

Ivory Composite API - COMMAREA Program + Web Service + 3270 Dialog

Insurance Company

- Mid-size Property and Casualty insurer
- Headquartered in the Midwest for 115 years
- 2400+ Employees
- Processes about 10 million transactions weekly

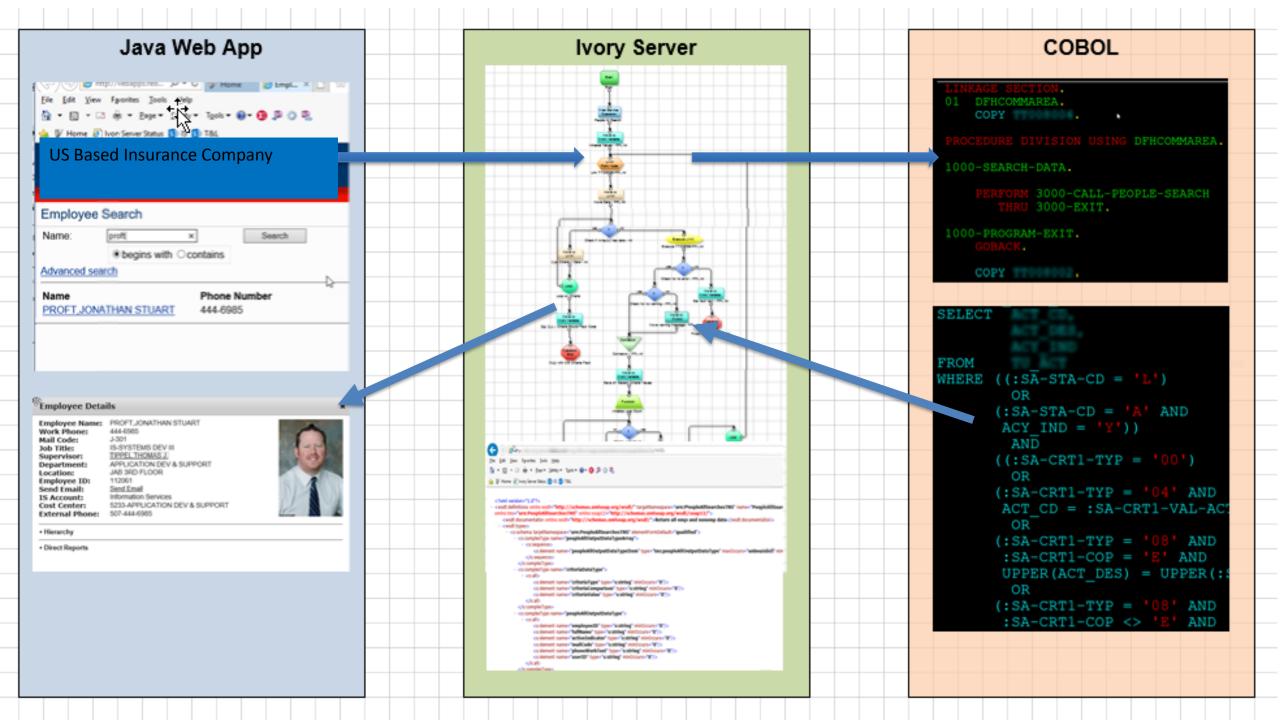

Insurance

- CICS systems of record
- Multiple Outbound calls to 3rd Party Geocode
- Calls to Legacy DB (DB2)
- CICS Links to multiple programs
- 3rd Party Lookup
- MVR Proof of Insurance
- Business Owner Policy Questionnaire
- Locate Your Rep
- Other applications
- VB Front End

Leading Aptitude Testing Company

- U.S headquartered, non-profit assessment vendor
- Develop and administer 50 million aptitude tests annually
- 180 countries —9,000 locations

- CICS systems of record
- Multiple Outbound calls to Google Geocode
- Calls to Legacy DB (IDMS)
- CICS Links to multiple programs
- Outbound Calls for External Credit Card Processing
 - Immediate Credit Approval
 - Two Large Back-End Online Systems
 - Real-time Communication with Third-Party Credit Card Processor
- Ability to process funds for payment
- Ability to track candidate's scheduling, testing, and scoring
- Both were green screen systems and would use same interface
- Neither coded to support encryption, SSL security and WS security tokens
 - a requirement for credit card processing.
 - Encrypted Security to meet PCI Compliance

GT Ivory[®] at One of the World's Largest Airlines

SCEPTRE

SCEPTRE stands for System Computerized for Economical Performance, Tracking, Recording, and Evaluation (airline technology)

Callable (outbound Services)

What are Callable Services?

- Access to SOAP and JSON Services via COBOL or PL/ICall
- Call Procedural Application Programming Interface (API)
- Used before API became a popular Web / Restful Service Term

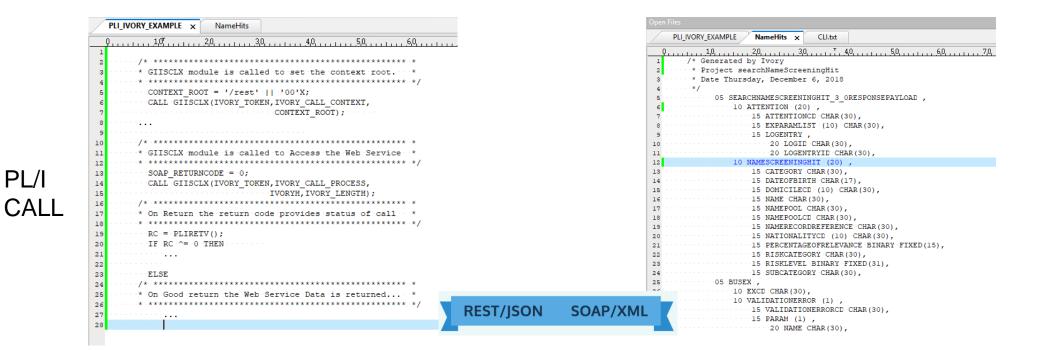

What is needed?

- Generation of Callable Service Interface (Call) for COBOL / PL/I
- Processing of all TCPIP Services for Target Service
- Dynamic Marshaling / Parsing of all XML and/or JSON

Callable(outbound Services)

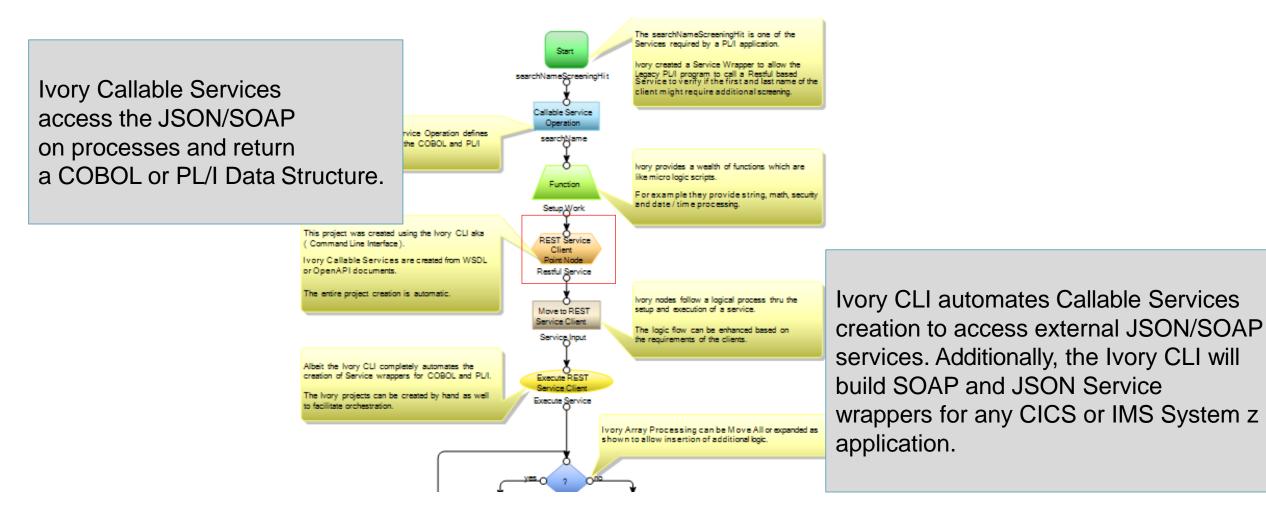

- Procedural Language API (Call)
- Procedural Language Data Layouts (Copybook)

PI/IData Area

Callable(outbound Services)

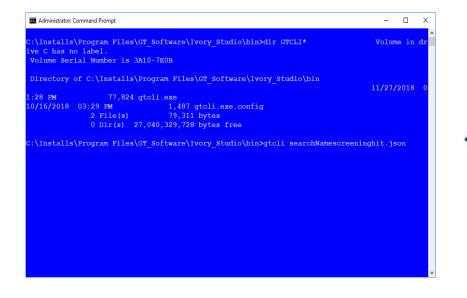

Command Line Interface (CLI)

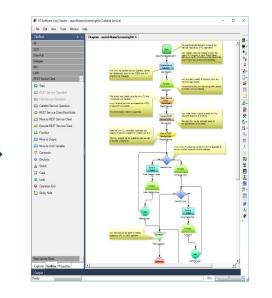

Command-Line Interface

A command-line interface or command language interpreter (CLI), also known console user interface and character user interface (CUI), is a means of interacting with a computer program where the user/client issues commands to the program in the form of successive lines of text aka command lines. Commonly processed by a command language interpreter or shell interface.

CLI

Ivory Studio

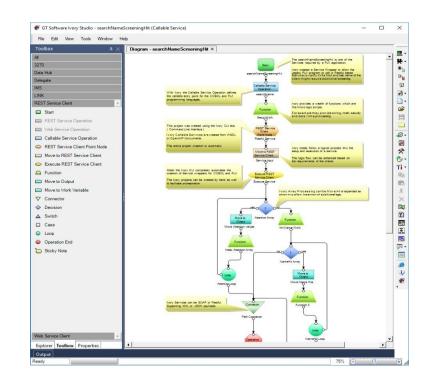

Command Line Interface (CLI)

- Command Line Interface
- Input...
 - OpenAPI (Restful JSON Services)
 - WSDL (SOAP XML Services)
- Generates Callable Services
- Removes XML/JSON Complexity
- Output...
 - Ivory Service Project

Case

- Governance and security
- Drag-and-drop (no coding) SDK
- Shared 'business' APIs across consumers
- No 'low level' coding and management of mainframe connectors
- Easy, fast, and agile development

- Founded in 1982 (HQ in Atlanta, GA)
- More than 35 years of market leadership
- Focused on real-time mainframe integration for strategic business initiatives
- Broad experience across all mainframe and distributed environments
- Worldwide cross-industry customers and strategic partnerships
