painting the picture

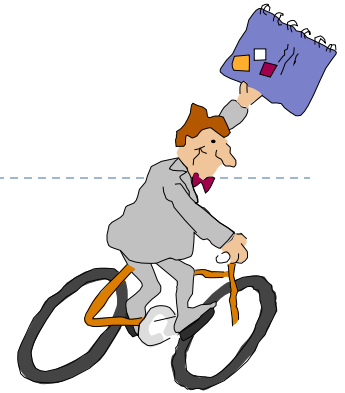

- ▶ **The Performance Challenge**
- ▶ Who told you that?
- ▶ Can you DIG IT?
- ▶ And this is how we do it...
- ▶ A Review

# The Performance Challenge

# Performance is a moving target!!

Business growth

New applications

New technologies

Mergers/acquisitions

CPU Creep

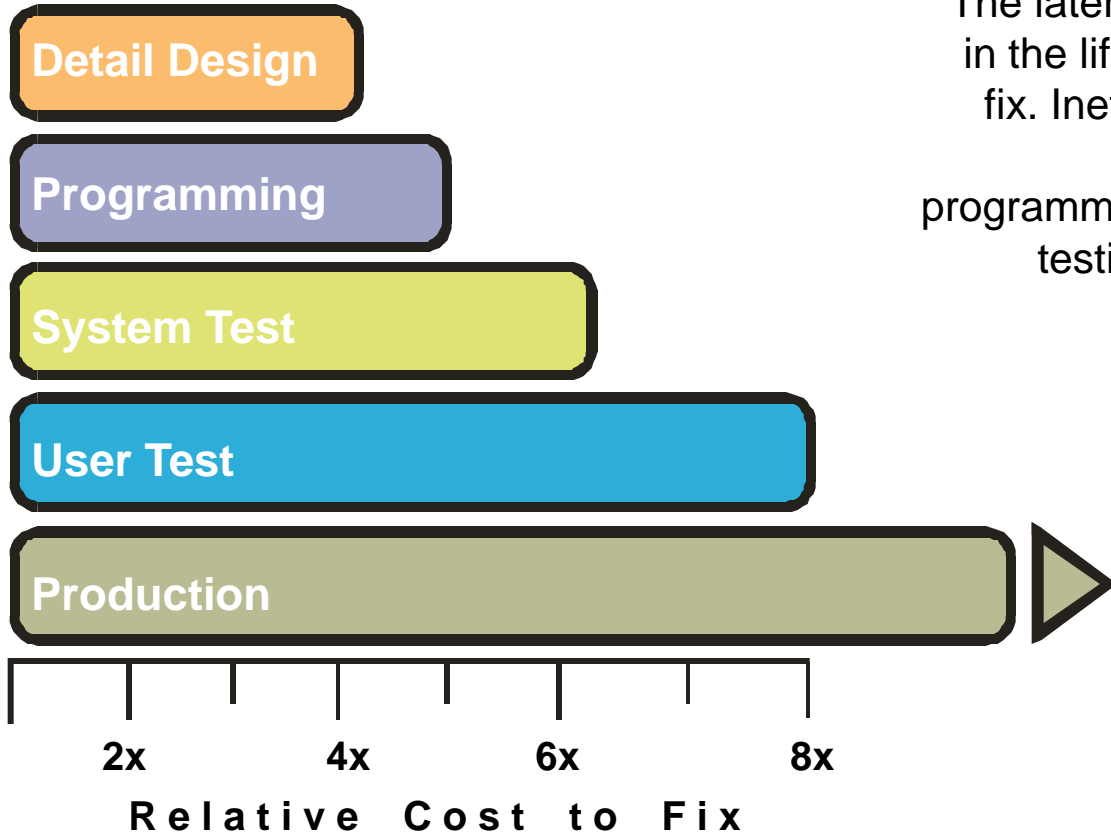

New system software

Defects and recurring faults

Distributed integration

# The Importance of Correcting Performance Problems Early

“The later performance problems are caught in the life cycle, the more costly they are to fix. Inefficiencies introduced in design can cost twice as much to fix during programming, four times more during system testing, and eight times more when the application enters production.”

Accenture

# Impact of Ineffective Performance Tuning

When performance issues are not dealt with:

- ✓ Poor customer satisfaction
- ✓ Increased processing costs
- ✓ Missed SLAs – penalty charges
- ✓ Lost business due to poor reputation
- ✓ Inability to scale to business requirements and growth

		Requirements	Design	Development	Testing	Production	Resolution cost for 100 defects at x = \$100
Cost of problem resolution		1x	2x	10x	50x	100x	
Firefighting	% resolved	0%	0%	0%	0%	100%	
	cost	\$0	\$0	\$0	\$0	\$1,000,000	<b>\$1,000,000</b>
Performance verification	% resolved	10%	0%	0%	60%	30%	
	cost	\$1,000	\$0	\$0	\$300,000	\$300,000	<b>\$601,000</b>
Performance-driven development	% resolved	10%	40%	25%	20%	5%	
	cost	\$1,000	\$8,000	\$25,000	\$100,000	\$50,000	<b>\$184,000</b>

# Impact of Ineffective Performance Tuning

## Lost CPU Time Summary

> five minutes	22,236.15	13	\$4,632.53	65.4%	6,036.36
----------------	-----------	----	------------	-------	----------

CPU Time	Lost CPU Time	Faults	Lost CPU Cost	Pct of Total	Worst Case
< one second	257.94	4429	\$53.74	0.8%	1.00
< five seconds	1,482.04	645	\$308.76	4.4%	5.00
< one minute	2,939.66	159	\$612.43	8.6%	56.84
< five minutes	7,091.06	54	\$1,477.31	20.9%	290.80
> five minutes	22,236.15	13	\$4,632.53	65.4%	6,036.36
<b>Totals:</b>	<b>34,007</b> seconds	<b>5,300</b>	<b>\$7,084.76</b>		<b>6,036</b> seconds

Lost CPU cost for Sample: \$7,084.76

Annualized Lost CPU cost: \$143,663.20

# The Performance Management Capability Maturity Model

## Where is your IMS?

**Level 4**  
Disciplined

Continually evaluate and improve your performance management program

Establish accountability for application performance. Track, measure and report on the *APM* program

**Level 3**  
Process oriented

Define processes for performance evaluation at established checkpoints

**Level 2**  
Proactive

Reclaim production resources through repeatable projects

Respond to production crises

**Organisational Benefits**

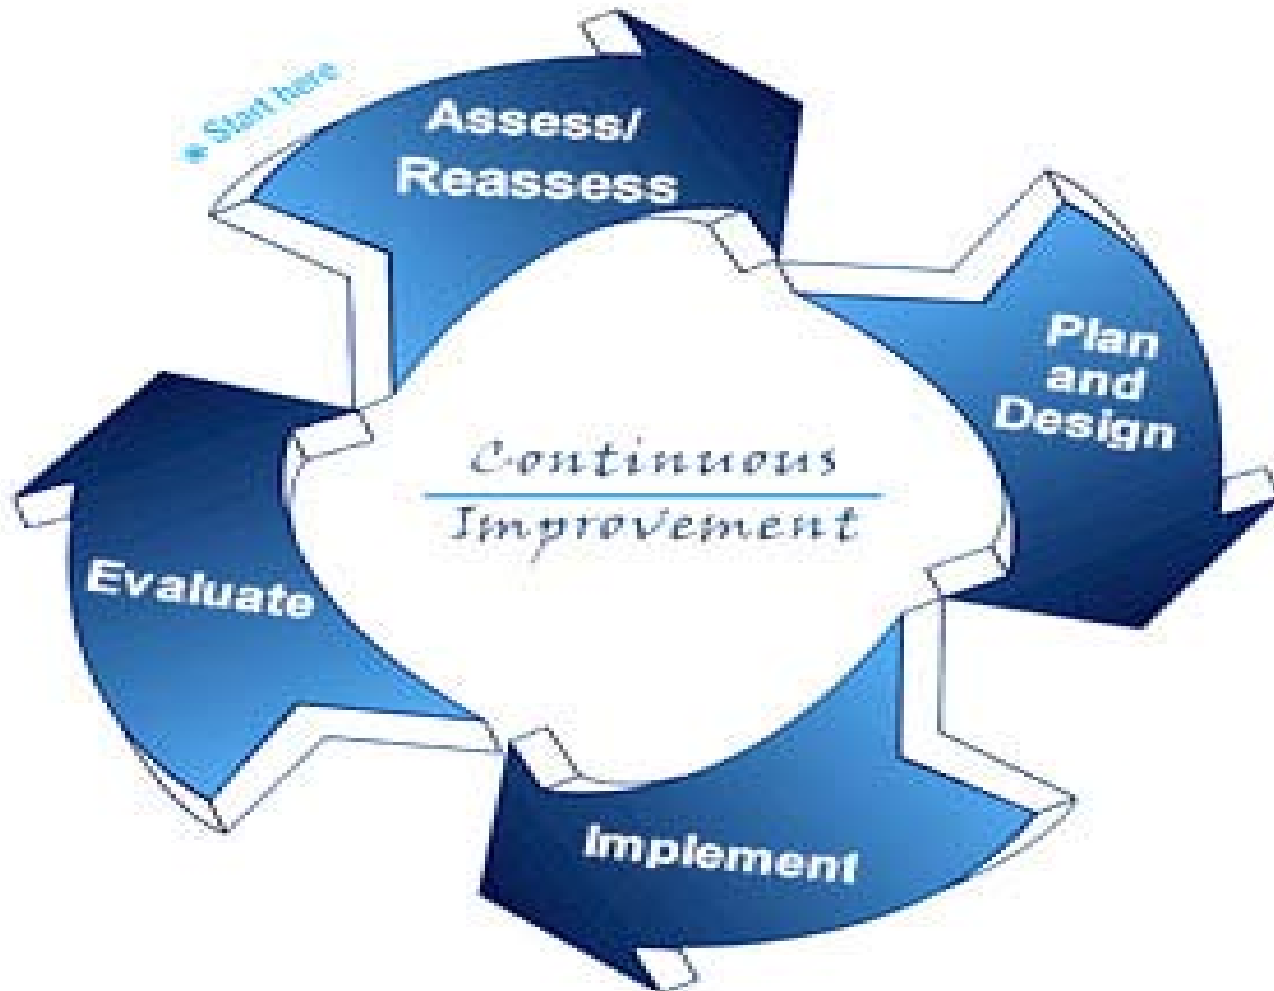

# The Performance Management Capability Maturity Model

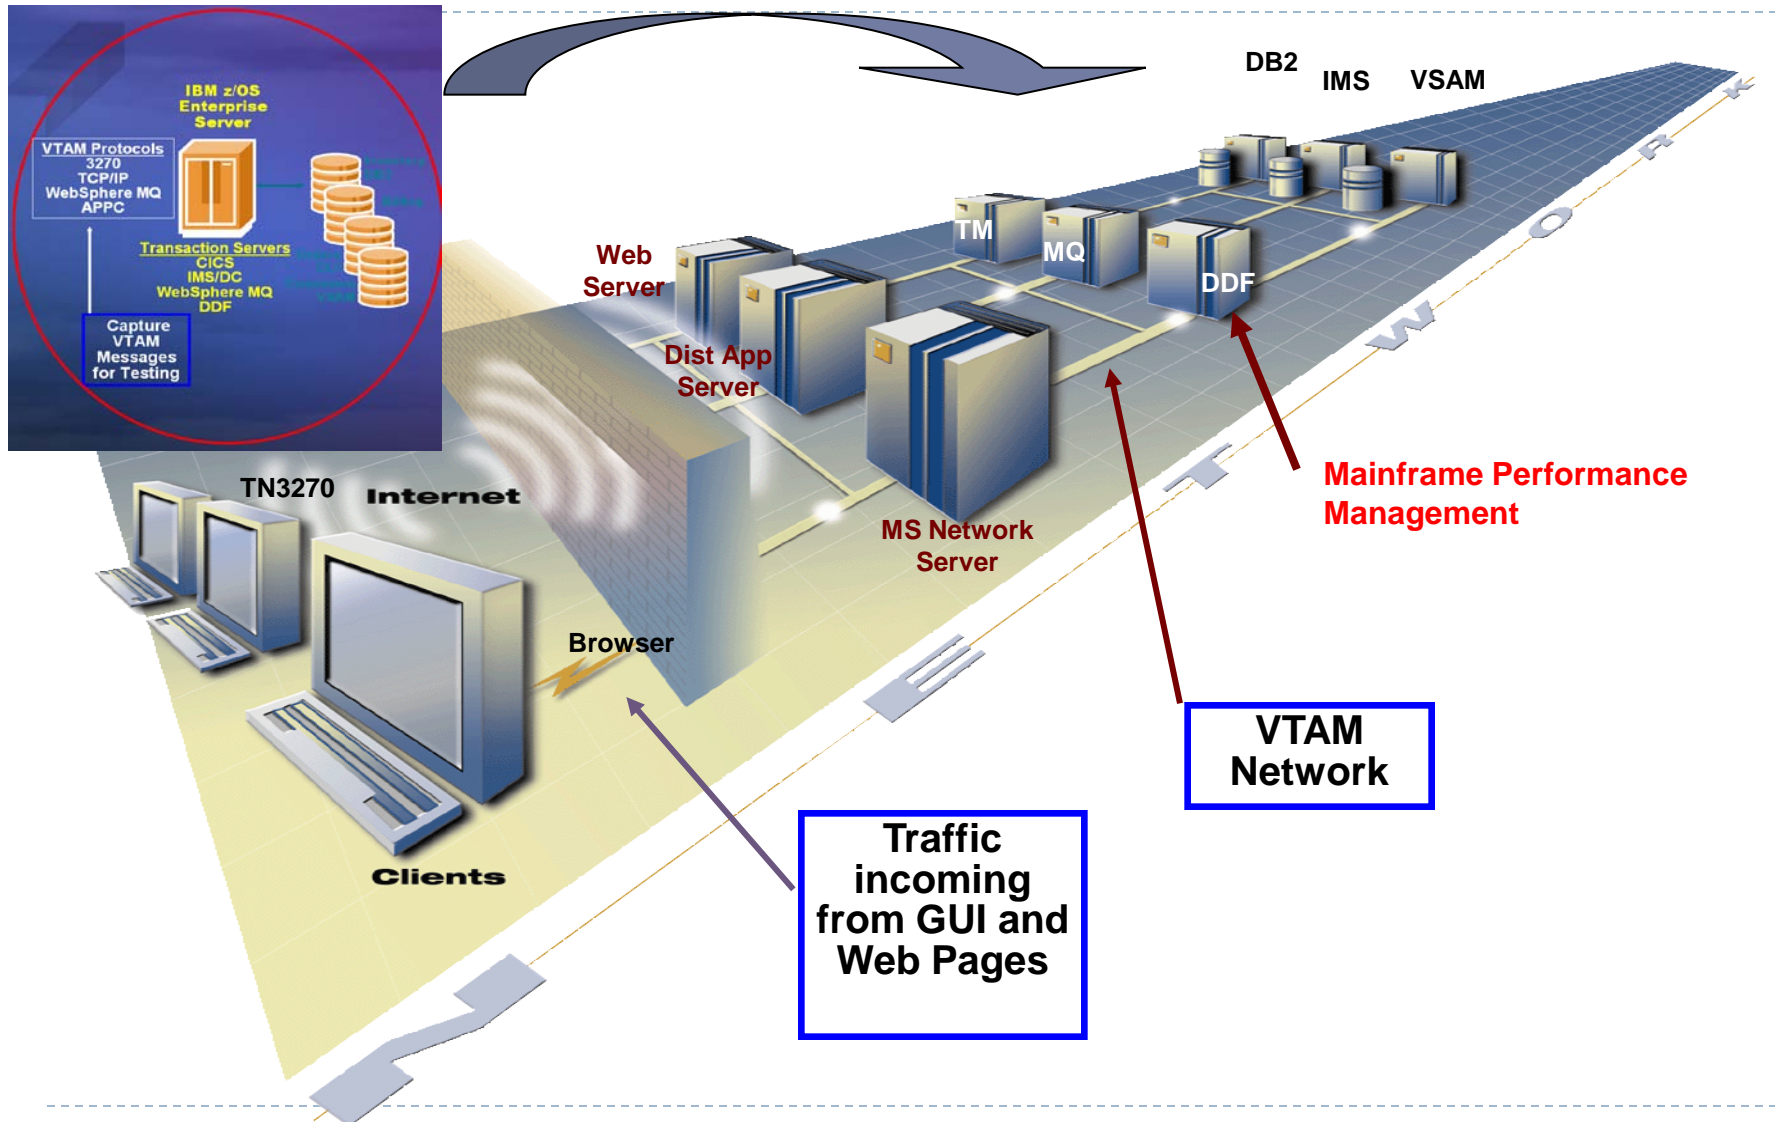

**Level 4**  
**Disciplined**

**Level 3**  
**Process oriented**

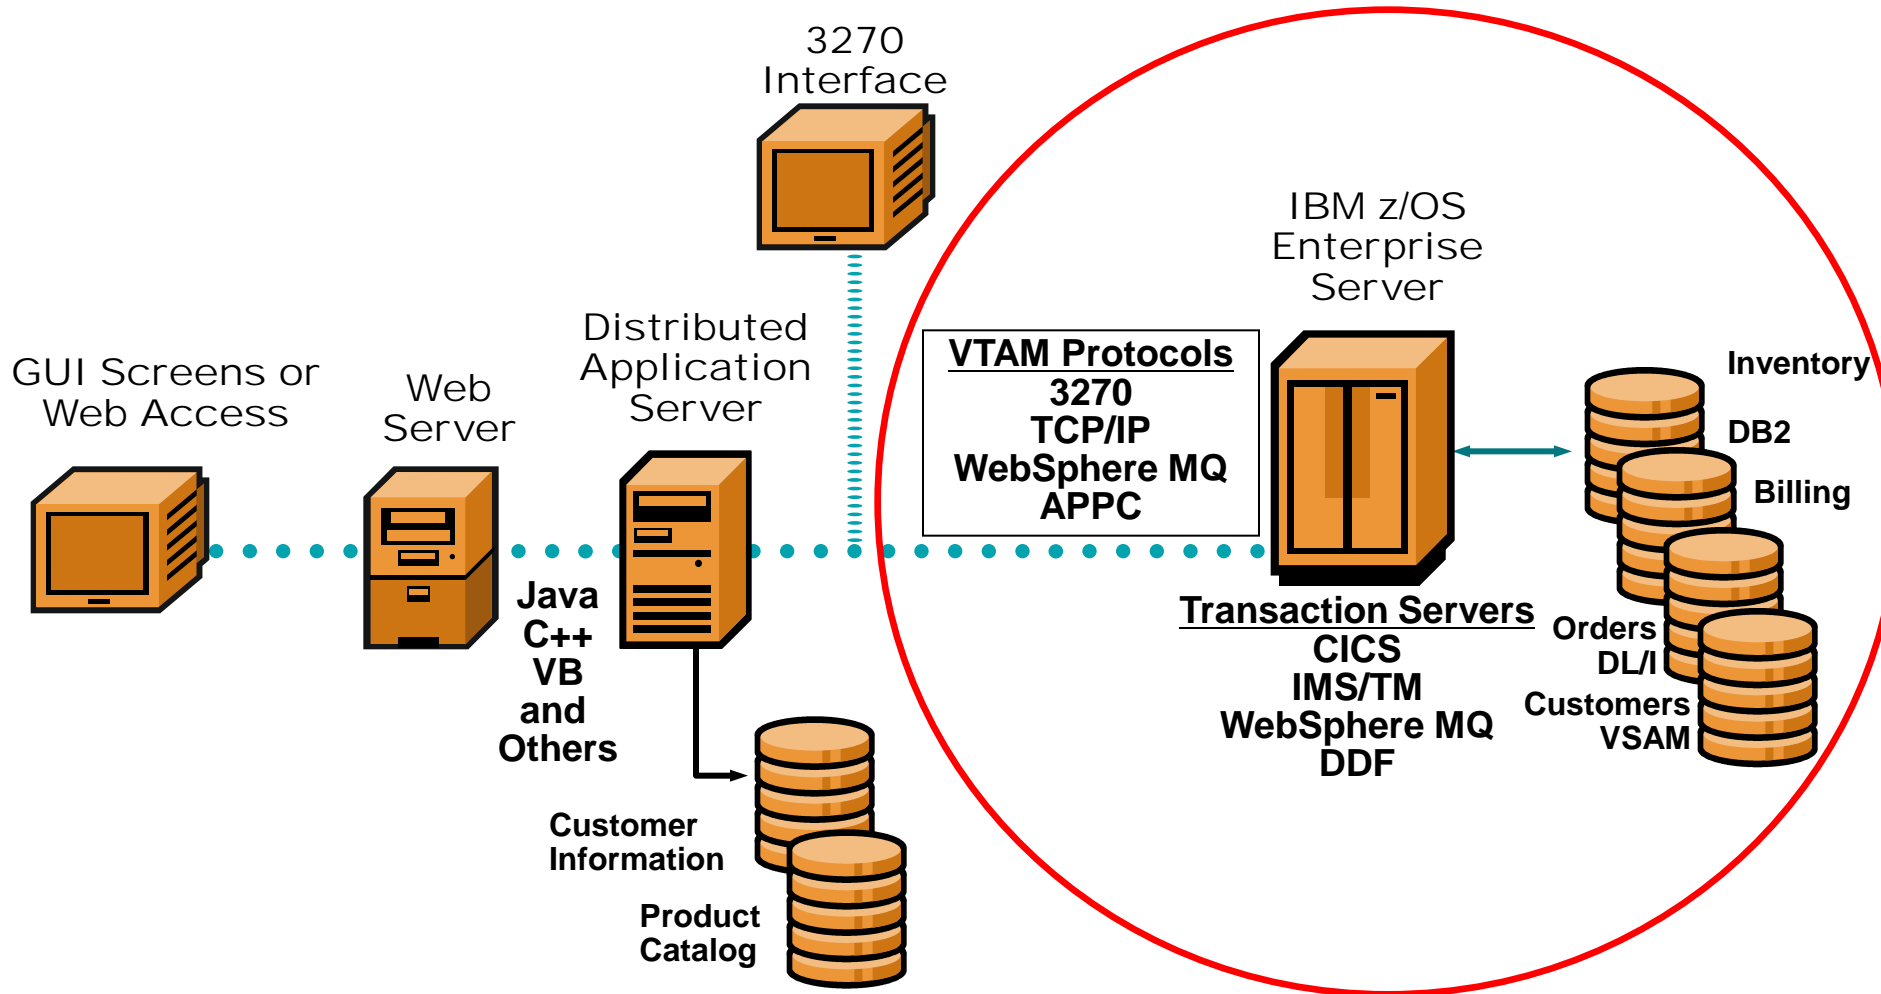

**Level 2**  
**Proactive**

# Let us know our systems...

# Let us know our systems...

# And what is IMS Performance?

---

- ▶ When we think about system health, we think about:
  - ▶ Efficiency
  - ▶ Code path length
  - ▶ Speed
  - ▶ Lack of bugs in code
  
- ▶ We also consider how easy new features are to use, whether new functions perform well, and how fault tolerant is our system

**An overall health measure for any operating environment,  
consists of a combination of all these**

# Have I got a problem?

---

“The performance of an IMS system is directly related to a number of internal variables.

These variables can be found in the z/OS® operating system, in IMS/TM, in IMS/DM, in the application, or in the hardware.

External variables include the network and the physical infrastructure of your private network.”.

RedBook IMS Performance and Tuning Guide <http://ibm.com/redbooks>

# Getting it straight

---

## A performing system

- ▶ CPU and DASD capacity planning
- ▶ many tools for tracking and predicting need for future hardware upgrades
- ▶ High-performing system = healthy system

### **IS NOT HEALTHY IF...**

- No log backups exist
- Most DBs are not registered in DBRC
- You are running IMS Version 6
- Maintenance is current to May 2008
- CPU is running at 100 percent capacity all day, every day

“Most technicians and managers equate health with performance; specifically, an IMS subsystem is healthy if some performance measure or metric remains high

Organisations that simply equate health = performance  
spend lots of time on performance tuning  
and reacting to real or perceived performance issues

**This deals with SYMPTOMS rather than causes”**

# The goal of any IMS installation

## Effective use of system resources!

- ▶ CPU cycles
  - ▶ real storage
  - ▶ I/O devices
- 
- ▶ Is this goal met?
  - ▶ What specific performance problems exist in the system?

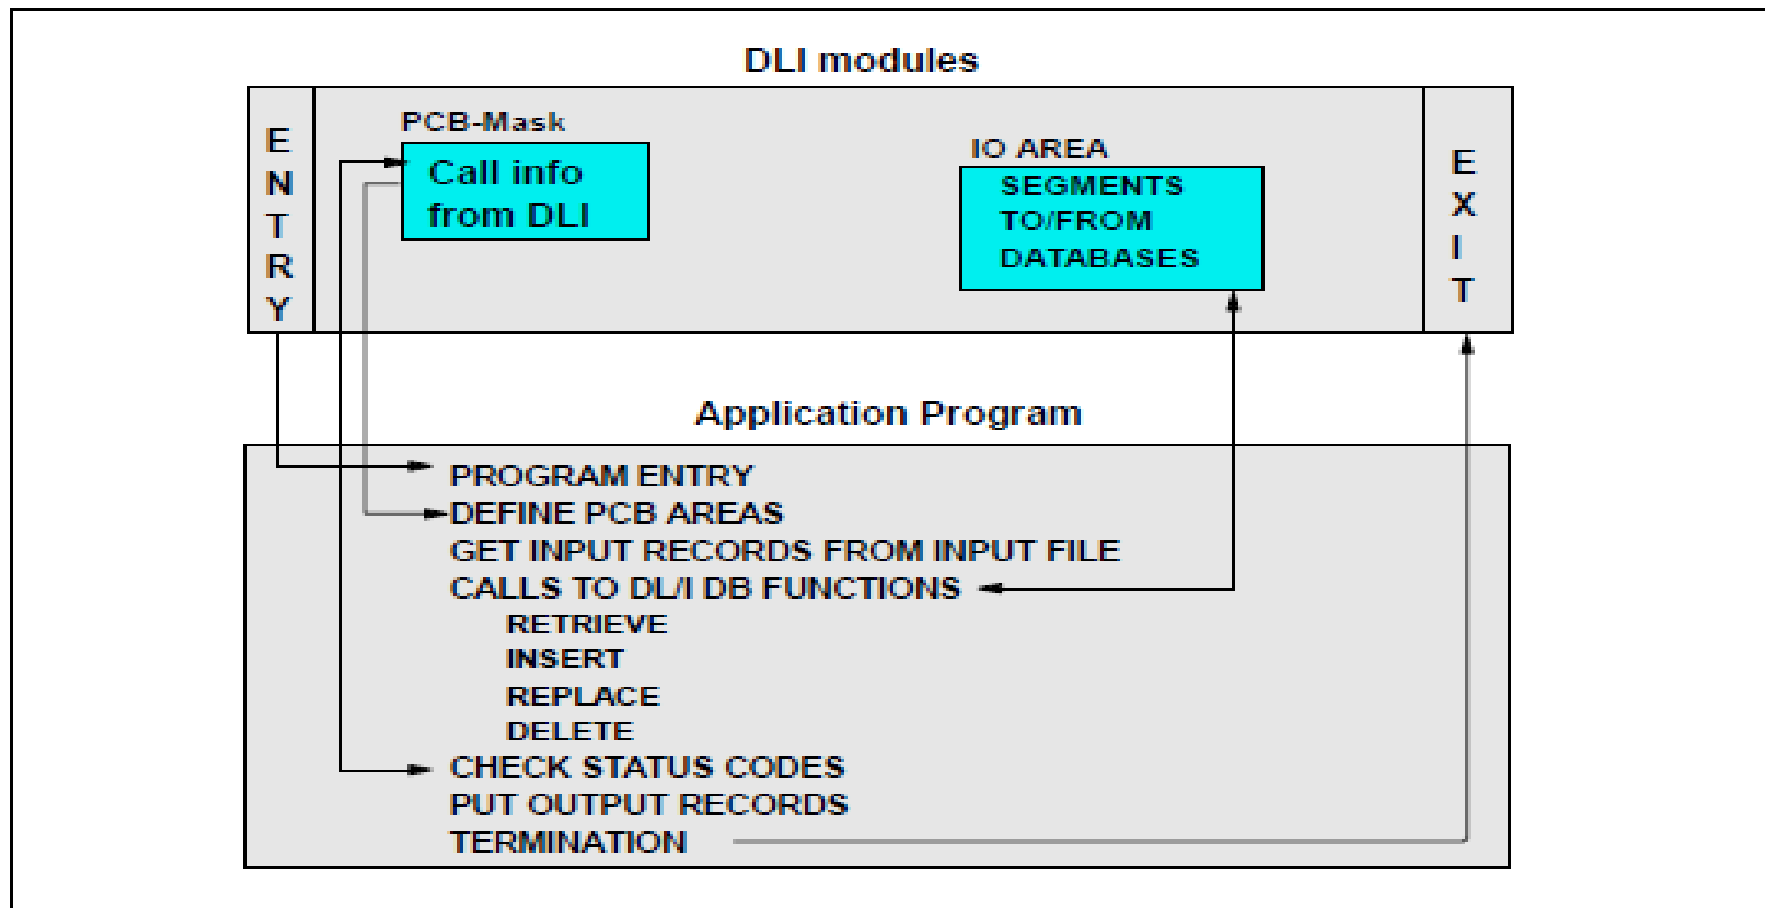

Let us examine the current use of resources

And then, when we implement any changes, we must re-evaluate the use of the resources again

# Why Tune IMS Applications?

## Structure of an IMS application program

# Why Tune IMS Applications?

---

## **APPLICATION DESIGN** **80%**

- Normalization
- Physical database design
- DL/I design and quality control
- Thread processing
- Dataset implementation
- Utility processing
- Etc...

## **IMS SUBSYSTEM** **10%**

- DBRC
- Shared queues
- LOG processing
- DB2 connections
- Etc...

## **MVS SYSTEM** **10%**

- Sub-system definition
- I/O configuration
- Etc...

- IMS Monitor trace, PI trace, PSB trace, and Fast Path trace provide a wealth of information:

- Elapsed time and CPU time
- Buffer pool statistics
- Wait counts and times (I/O, locks, latches, etc)
- Region information
- DL/I count information
- DB processing information

# About IMS Traces and Monitors

---

- ▶ Recommended regular reports
  - ▶ IMS Monitor
    - ▶ Buffer pool statistics ,general reports, Region/  
Program/Communication summary, I/O details,  
VSAM Buffer Pool reports
  - ▶ KBLA / DFSERA10
    - ▶ Log data
  - ▶ DFSILTA0
    - ▶ Log transaction analysis
  - ▶ DFSKMSC0
    - ▶ MSC link response times
  - ▶ DBCTL
  - ▶ IRLM locks
  - ▶ IMSplex information
  - ▶ IMS Connect information

## ***The Logical Tuning Approach***

# IMS performance – taming the beast

painting the picture

- ▶ The Performance Challenge
- ▶ Who told you that?
- ▶ **Can you DIG IT?**
- ▶ And this is how we do it...
- ▶ A Review

Can you DIG IT?

Sub-system and  
application  
tuning...

# Check this out for a healthy IMS Sub-system

Basically, these are the main things to be monitored  
ANYWAY, even if nobody touches the applications...:

<b>SMP maintenance</b>	includes looking at all the holddata for stuff that has to be rebound (usually every 3-6 months)
<b>Bufferpool / message queue pool settings</b>	if you have enough memory to just make them big, check every couple of months
<b>IMS parameters</b>	some people don't ever change them, but number of log buffers and checkpoint frequency are 2 that can have major impact on performance
<b>backups</b>	to make sure they run and run correctly – OLDS, SLDS, trace and monitor data

# Check this out for a healthy IMS Sub-system

---

## 1. DR

- Co-ordination of logs and IC
- Existence of a D/R plan
- Backups

## 2. Growth

- Measurement of percent busy
- CPU-bound vs. I/O-bound
- Quantity of traffic through DDF
- Transaction throughput and DL/I calls (query vs. update)
- Logging activity
- Memory activity
- Current bottlenecks

# Check this out for a healthy IMS Sub-system

---

## 4. Stability

- Maintenance process (version, currency)
- Regular upgrades
- Software maintenance strategy
- People
  - Business skills – Time management, meetings, communications
  - Problem solving methodology
  - Education, training, certification
- Process monitoring
  - Documentation: update, upgrade, centralise, review
  - Process measurement

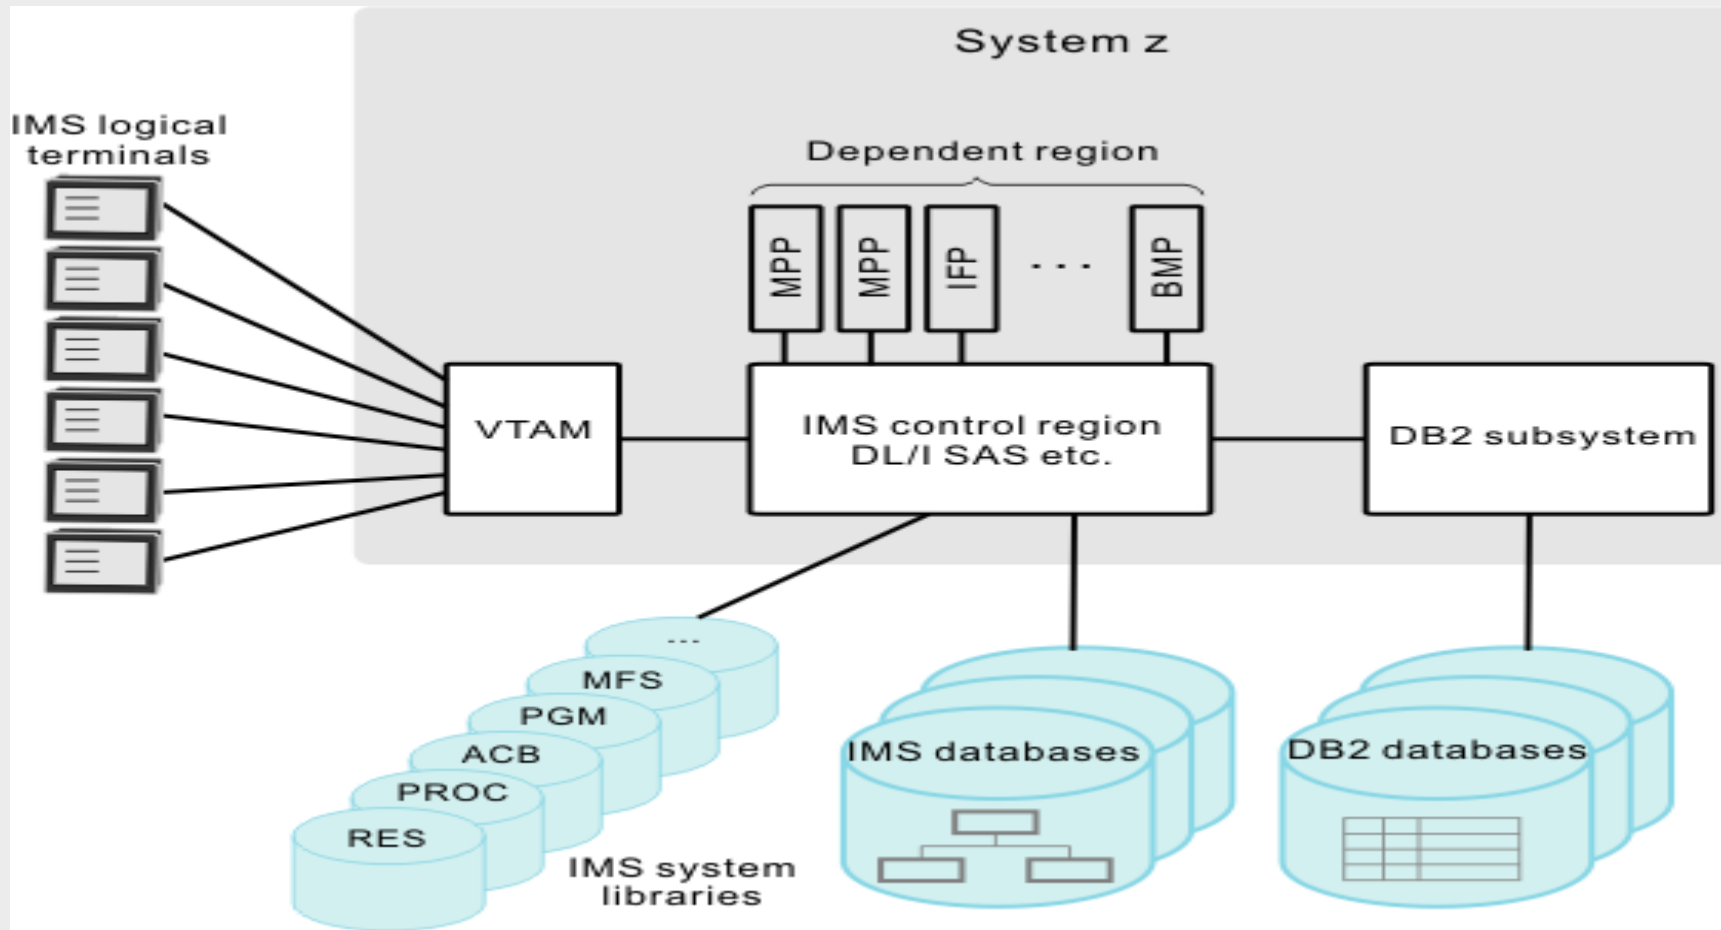

## 5. Maturity

- CMM Level

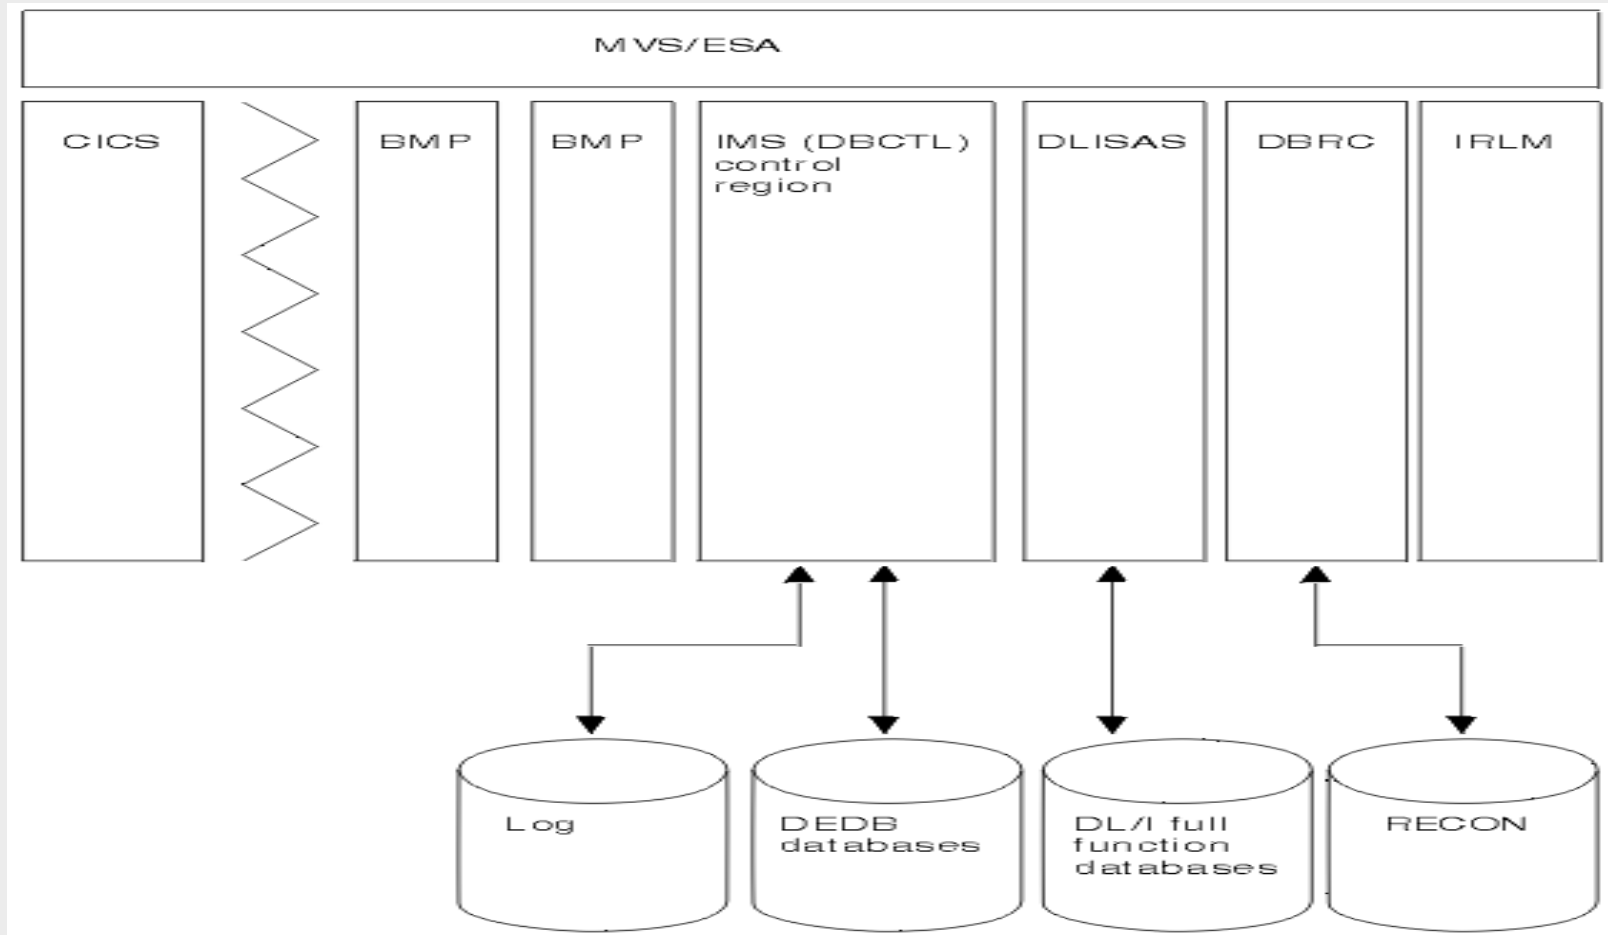

# The Mysterious and Complex World of IMS

Typical structure of an IMS online system environment

# The Mysterious and Complex World of IMS

CICS-IMS DBCTL environment

# WLM Analysis

---

First degree of separation:

- ▶ long running bad transactions from transactions that run quickly

Then:

- ▶ transactions that run quickly into high, medium, and low volume transactions

Service Classes definition:

- ▶ for all region types based on transaction class rather than transaction codes

**Too many service classes can produce unpredictable results**

Response times:

- ▶ average host response times for all workloads
- ▶ what % of workloads will meet the average response times (SLA)?
- ▶ set up the workload using response time % and performance goals

# Database Performance agents

---

- ▶ Which access method?
  - ▶ HISAM / HD, (P)HDAM / (P)HIDAM, HALDB, OSAM / VSAM
  - ▶ If you have HALDB: Partition criteria – Key range is generally appropriate
- ▶ Block sizes, CI sizes, and record sizes
- ▶ Free space
- ▶ Randomization parameters: randomization routine, RAPs, RAA, bytes parm
- ▶ Fixed length / variable length segments: what type of data goes in them?
- ▶ Pointer options: pointer maintenance
- ▶ SCAN= parameter on DATASET statement: free space searches
- ▶ Multiple data set groups: do you need them?

# Database Performance agents

---

- ▶ Compression: storage, I/O and CPU usage considerations
- ▶ Encryption: do you need it?
- ▶ Secondary indexes: unique keys, duplicate data fields, shared indexes
- ▶ Fast Path performance considerations: VSO, Field calls, Buffers
- ▶ Non-recoverable databases
- ▶ OSAM or VSAM? OSAM is better with IMS but requires attention
- ▶ GSAM performance: PROCOPT, BUFNO, DCB=OPTCD=C
- ▶ REORG strategy

# Transaction Manager Performance agents

---

- ▶ Call scheduling options: processing, classification, queuing
- ▶ Program load options: COBOL, DBLDDL, LE, LLA
- ▶ TRANSACT macro parms: MAXRGN, SEGNO, PARLIM, PRTY, PROCLIM

# IMS TM Performance agents: IMS Parameters

---

- ▶ **Buffer Pools**
  - ▶ for Fast Path: DBBF, DBFP, DBFX
  - ▶ Dynamic Pool manager (DFSPOOL) thresholds
  - ▶ Message format BP parms
- ▶ **IMS I/O Activity and Performance**
  - ▶ I/O sub-system performance
  - ▶ IMS Scheduling and Application I/O performance
  - ▶ ECSA / CSA usage
  - ▶ Dependent region PST
  - ▶ Message Queue buffers
  - ▶ RES PSBs and DMBs, page fixing
- ▶ **IMS Locking Activity**
  - ▶ IRLM lock activity, Claim and Drain activity
  - ▶ Lock contention and Lock escalation
- ▶ **IMS Logging**
  - ▶ Number of logs, single/dual logging, log I/O activity and checkpoint activity
- ▶ **DBRC**

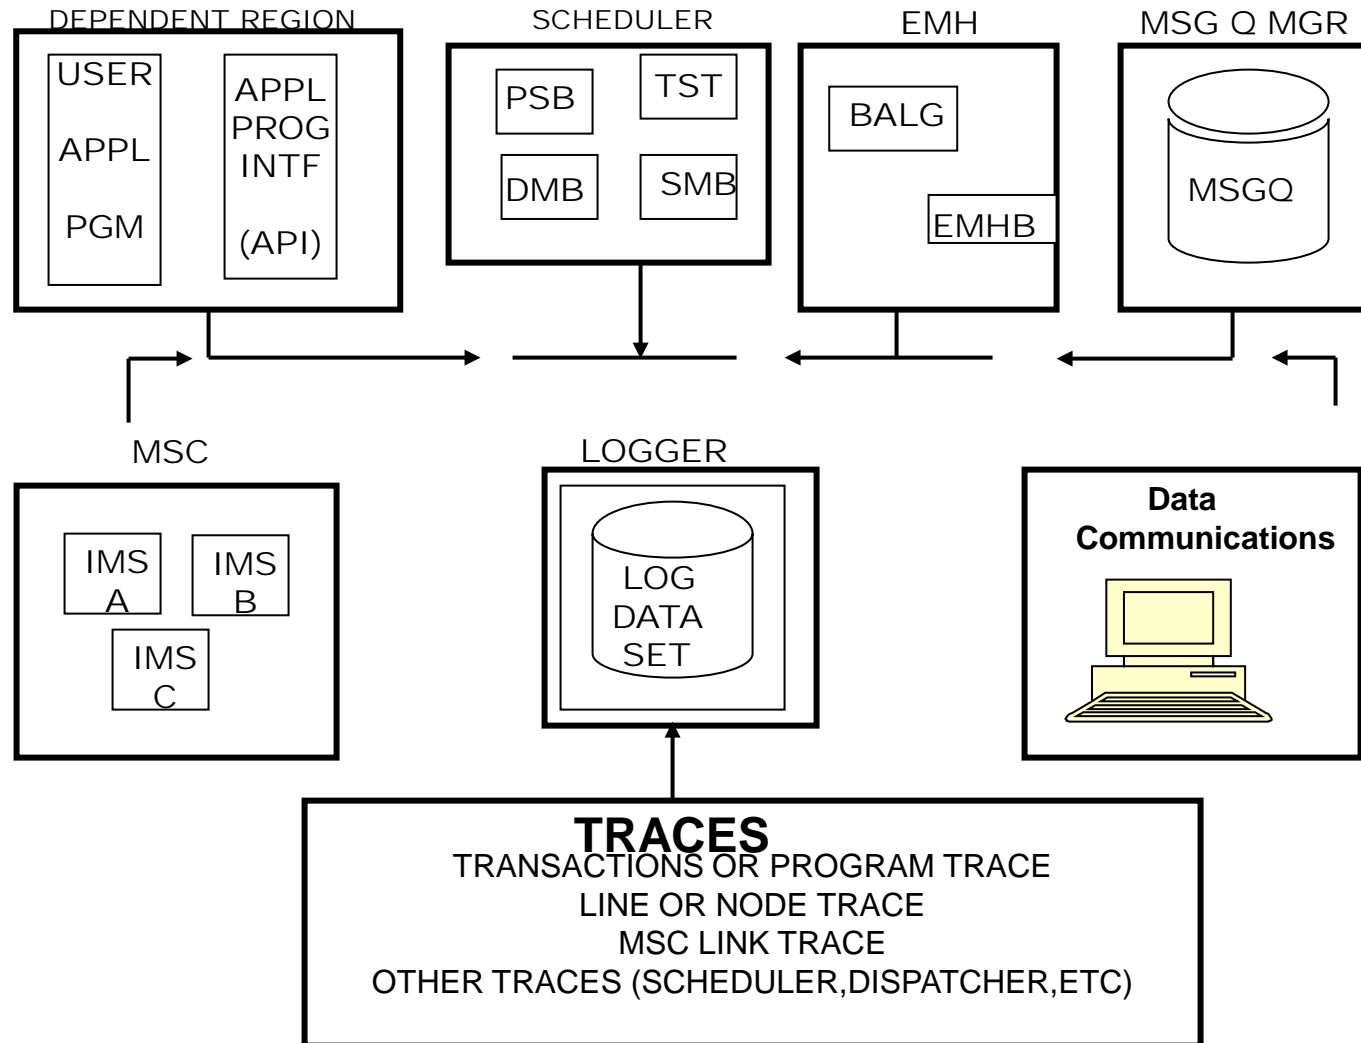

# DBCTL Performance agents

---

- ▶ **DFSPZPxx**
  - ▶ for Fast Path: FPBUF
  - ▶ Overflow buffers
  - ▶ Thread parms
- ▶ Variable pool allocation parms
- ▶ **DFSPBxxx**
  - ▶ Thread parms
  - ▶ Storage pool management
- ▶ **IMS Logging**
  - ▶ Number of logs, single/dual logging, log I/O activity and checkpoint activity

# Logging and IMS

# IMS Logging Considerations

---

- ▶ Every task in IMS must log
  - ▶ IMS has a physical logger and a logical logger
    - ▶ Each of these functions has its own TCBs
  - ▶ Two types of logs:
    - ▶ write ahead data set (WADS)
    - ▶ online log data set (OLDS)

A large IMS subsystem can perform enormous amounts of logging

- ▶ on CPU with 64-bit support (z/Architecture), log buffers are page fixed above the 2 GB line
- ▶ For this, OLDS block size must be multiple of 4096 (without exceeding half track value)
- ▶ With previous recommended block size of 26 624 we cannot use storage above the line
- ▶ If you increase your log buffers, careful with WADS (size of the WADS must be increased)
- ▶ Ensure the correct number of OLDS buffers are defined in DFSVSMxx

# IMS Log Record format

---

## Log record format

<b>LL</b> 2 Bytes	<b>ZZ</b> 2 Bytes	<b>RECORD TYPE</b> 1 Byte	<b>RECORD SUBTYPE</b> 1 Byte	<b>RECORD CONTENT</b>	<b>STCK</b> 8 Bytes	<b>LSN</b> 8 Bytes
----------------------	----------------------	------------------------------	---------------------------------	-----------------------	------------------------	-----------------------

**LL = Variable length field**

**ZZ = Usually binary zeroes**

**STCK = Binary value for hardware clock**

**LSN = Log sequence number**

**Record Type and subtype show type of log record.**

# Other IMS Performance agents

---

- ▶ **DBRC - RECONS**
  - ▶ Dataset definition
  - ▶ Dataset contention issues
    - ▶ GRS
  - ▶ Dataset maintenance
  
- ▶ **SMF and RMF**
  
- ▶ **Batch applications**
  
- ▶ **IMS Utilities:**
  - ▶ Change accumulation, pointer checker, image copy, recovery utilities, etc.

# IMS performance – taming the beast

---

painting the picture

- ▶ The Performance Challenge
- ▶ Who told you that?
- ▶ Can you DIG IT?
- ▶ **And this is how we do it...**
- ▶ A Review

---

# And this is how we do it

## Re-writing the process

# The tools we need to check our IMS's health

---

## 1. Tick-boxes:

- ✓ DR practices
- ✓ Capacity Planning
- ✓ Proactive, predictive, self-healing
- ✓ Stability
- ✓ Maturity

## 2. Tuning knobs:

- Sub-system configuration
- Catalog and directory
- Access Paths
- Data: volumetric and configuration
- Process objects

# The next steps: Autonomic Computing

---

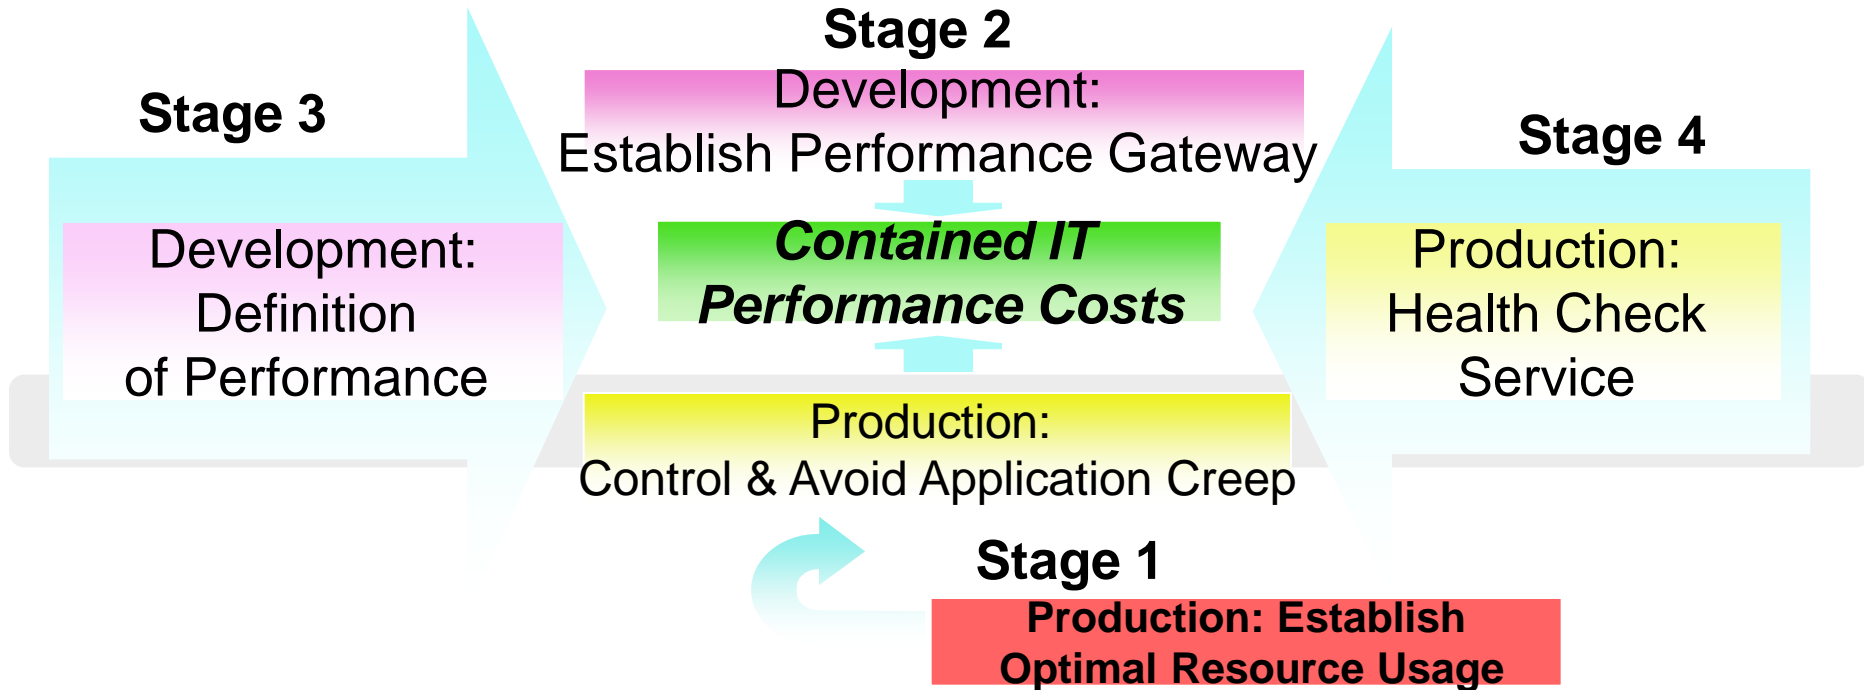

1. Collect multiple sources of event, threshold, and statistical data
2. Consolidate, analyse, and report data using performance management tools
3. Use correlations and recommendations available from monitoring software and other sources
4. **SCRIPT!**
5. Integrate components for dynamic management

## Performance monitoring Strategy:

transaction and application profiling

- ✓ The objectives of performance testing are defined for specific applications/transactions
  - ✓ Every application/transaction will have its own objectives, and its own limits, according to the use which is made of it

# The holistic approach: what is at stake?

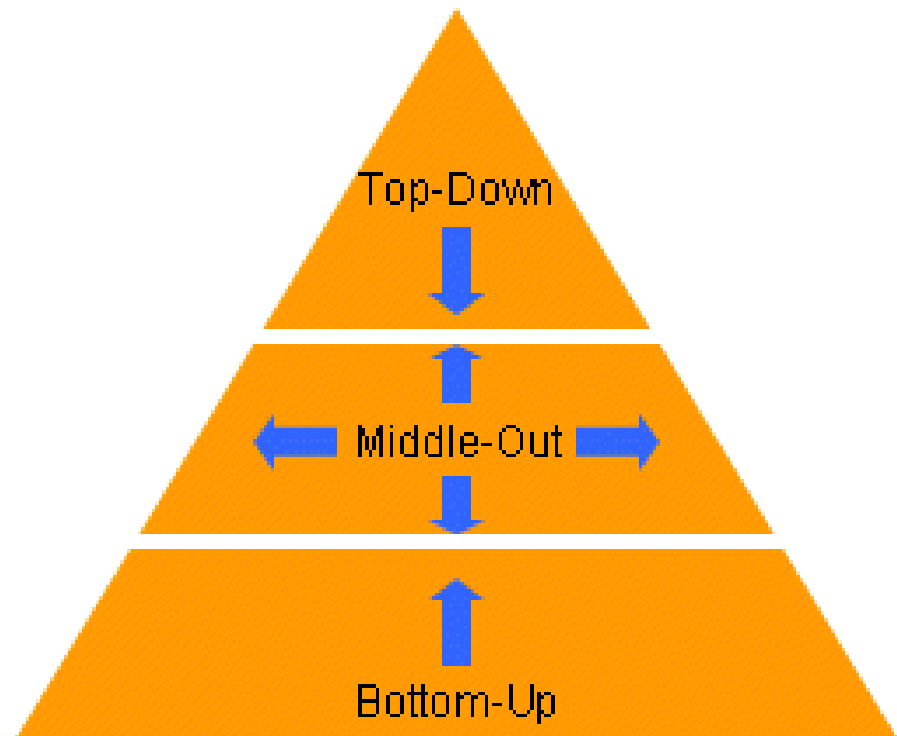

---

## Quality

- ▶ User benefits
  - ▶ Service contracts quality assurance
  - ▶ User and customer satisfaction

## Budget

- ▶ Profitability of the data-processing investment

# IMS performance – taming the beast

---

painting the picture

- ▶ The Performance Challenge
- ▶ Who told you that?
- ▶ Can you DIG IT?
- ▶ And this is how we do it...
- ▶ **A Review**

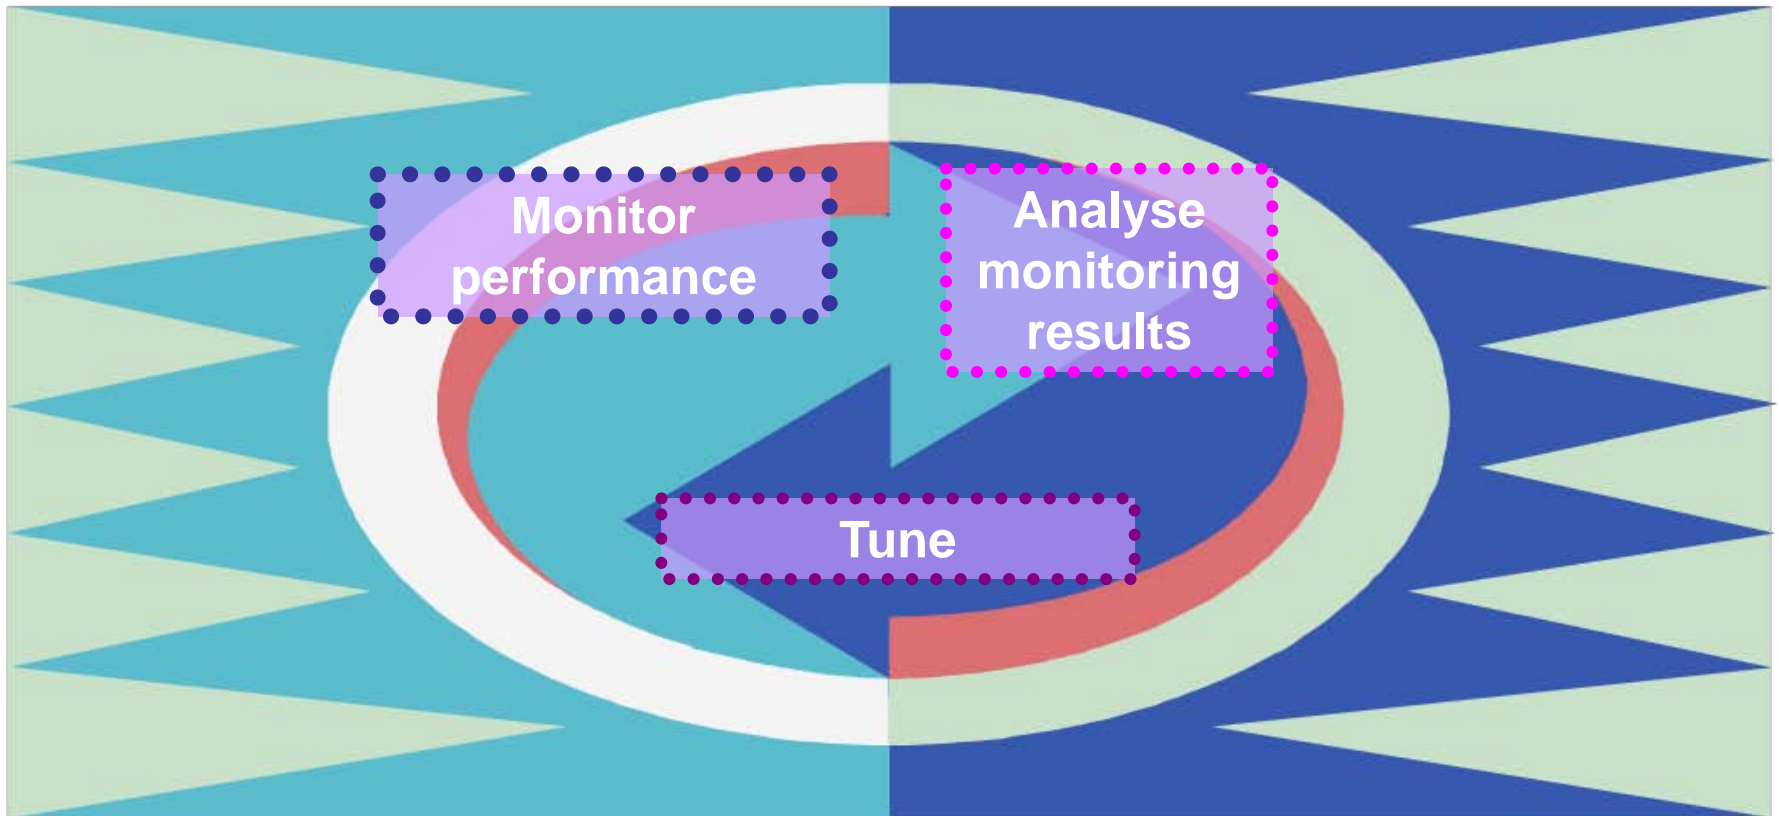

**In short - a review**

# The ultimate holistic approach

1. Define performance objectives & metrics
2. Create monitoring, testing and tuning procedures
3. Implementation practice – again from the top!

# Read the books!!!!
